CALL FOR PAPERS

Call for Special Issue Papers: **Internet of Things Data Visualization for Business Intelligence**

Deadline for Manuscript Submission: September 12, 2020

Guest Editor: **Neeraj Kumar**, *Thapar Institute of Engineering, Thapar University, India.*

Internet of Things (IoT) data visualization is gaining popularity among researchers and industrialists across various disciplines. Present-day businesses already know that data visualization in business intelligence forms an integral part of competitive success. Yet, several organizations are subsiding behind due to their lack of ability to cope up with the information demand. The major pitfall resides in the fact that most organizations fail to acquire the current trend of information from valid resources. In recent decades, the evolution of IoT devices acts as a destination for data resources with the most real-time information. The process of IoT data visualization greatly influences the success of business organizations with state-of-the-art data resources. It is primarily due to the reason that IoT data visualization enhances the productivity and efficiency of the business in a most significant way. With the help of modern IoT technologies, business organizations could gain deeper access to the data by utilizing the human sense of vision, sound, and touch factors.

In a business intelligence environment, organizations usually collect data from various sources; the collected data is then stored and processed for business, economic, social, legal, technological, and environmental purposes with a wide range of business tools. The process of IoT data analytics and visualization helps organizations to explore profound insights into the most recent unprocessed data. Such kind of data-driven results provides progressive developments to organizations. However, researchers suggest that there are numerous challenges in IoT data visualization for business analytics processes. Some of them include the size of the IoT data (volume), heterogeneity of the IoT devices, analytics at the edge devices, need for scalable and efficient storage infrastructures, data security, data privacy, reliable validity of marketing segmentation, and financial management issues.

Moreover, the dynamic macro level parameters external to the organizations also play a major part in the extent to which IoT data visualization could be used in business decision-making activities. Hence, it is mandatory to identify various micro and macro-level factors that affect the use of the IoT data visualization for business intelligence processes.

Data analytics in business intelligence does not work in isolation; in contrast, it considerably impacts the growth of business outcomes. Also, there are very limited works available in the past that confluences IoT data visualization for business intelligence processes. This special issue aims to bring out various factors that affect the use of IoT data visualization in business and to explore various effective implications for IoT data visualization in business intelligence.

The list of topics for the special issue includes, but is not limited to, the following:

- Reliable and efficient implementation frameworks for IoT data visualization in business intelligence
- Critical examination of dynamic factors in the field of marketing, finance, human resource and organizational human behaviour and operations that affects the growth of IoT data analytics across business organizations
- State-of-the-art tools and techniques intended for effective IoT data visualization processes for business intelligence
- Marketing and management of business process with IoT data visualization techniques
- Implication and frontiers in IoT data visualization for business intelligence
- Big data analytics and management techniques for IoT data visualization in business intelligence
- IoT data visualization for decision making and business support
- Security and privacy of IoT data in business intelligence
- Data Visualization for Enterprise resource planning (ERP) and customer relationship management (CRM) to improve business intelligence
- Innovative methods for IoT data visualization and business analysis
- IoT data mining and knowledge discovery for effective data visualization and analysis processes
- Integrating Business forecasting models with IoT business intelligence systems
- Machine learning and artificial intelligence for IoT visualization and business intelligence
- Achieving a secure and efficient IoT business intelligence environment with blockchain and federated learning methodologies
- Methods and practices for mining unstructured, spatial-temporal, streaming and multimedia IoT data for business intelligence

The deadline for manuscript submission is **September 12, 2020**. We welcome manuscripts from scholars across the social and computer sciences, and are particularly interested in research from teams of authors from both domains of inquiry. Instructions for Authors are available on our website at www.liebertpub.com/big

Please direct special issue inquiries to Dr. Neeraj Kumar at neeraj.kumar@thapar.edu

Please submit your papers online to our web-based manuscript submission and peer-review at: www.liebertpub.com/manuscript/big

Big Data is a highly innovative, peer-reviewed journal, provides a unique forum for world-class research exploring the challenges and opportunities in collecting, analyzing, and disseminating vast amounts of data, including data science, big data infrastructure and analytics, and pervasive computing.

Deadline for manuscript submission: September 12, 2020

Special Issue Publication date: Early 2021

Advantages of publishing in **Big Data** include:

- Fast and user-friendly electronic submission
- Rapid, high-quality peer review
- Maximum exposure: accessible in 170 countries worldwide
- Open Access options available

Visit the Instructions for Authors:
www.liebertpub.com/big

Submit your paper for peer review online:
<https://mc.manuscriptcentral.com/big>
